

Bryan - Soft Convex

Background

Bryan is an 85-year-old man with terminal cancer. He was bed bound with a large abdominal wound and an lleostomy ten months post op.

Problem

The Peristomal skin was so sore, bleeding, very moist and painful. None of the stoma bags he had would stick resulting in constant leaks and increasing the soreness daily.

Course of treatment

Bryan used the Vitamin E Soft Convex drainable bag. There were no complications at all, his skin was almost healed in a week. The leaks stopped immediately and Bryan commented how quickly his skin had healed and how it all felt so comfortable now.

Conclusion

The treatment was a complete success and saved costs as the bag was only changed every three days instead of several times a day.

"The patient's skin was almost healed in a week"

All statistics, case studies, quotations are based on real world user and/or HCP experiences of using the product as part of an overall stoma care regime. The evaluation did not constitute a randomised or controlled study. All data is held on file by Pelican Healthcare.

David - Firm Convex

Background

David is a 63-year-old man who had a stoma formed 2 years ago due to UC. He has good mobility and works as a gardener.

Problem

Post op David experienced leaks and then developed a prolapsed stoma. The condition of the skin was dry and irritated due to constant leaks.

Course of treatment

David was given Platinum with Vitamin E Firm Convex to trial.

Conclusion

David used the Pelican Firm Convex pouch for 2 weeks and didn't experience any leaks whilst trialling the pouch. This was a significant improvement as he has been experiencing consistent leaks before the trial.

David's average wear-time with the Pelican product was 72 hours, which is a significant improvement to his current non-Pelican pouch.

The condition of his skin improved within 14 days from dry to normal skin.

"Very happy with trial pouch, didn't try any of the others. This one was so good, no leaks and keeps my prolapse in"
